

OLIVER ONDOY

Role: Backend Developer | Cybersecurity

 Pangasinan, Philippines  oliverondoy@gmail.com  github.com/Sucrit

ABOUT ME

3rd-year BSIT student and backend developer specializing in secure, scalable systems and RESTful APIs. Practical experience with MERN, Laravel/PHP, and MySQL; containerized deployments (Docker) and CI/CD. Competent in digital forensics, memory analysis, and homelab-driven threat research. Actively learning blockchain and AI/ML. Open to remote freelance projects.

EDUCATION

UNIVERSITY OF PANGASINAN Bachelor of Science in Information Technology	2024 - 2027
BUGALLON INTEGRATED SCHOOL Junior & Senior High School	2016 - 2022

SKILLS

- MongoDB
- Node.js
- Docker
- Github
- Python
- Express Framework
- MySQL
- Linux
- PHP (Laravel)
- TypeScript

PROJECTS

Roomfinder

Role: Backend Dev

2ND YEAR COLLEGE PROJECT

EvacuDesk is a Node.js / Express backend built to improve evacuation center management in Dagupan City, Pangasinan. It supports evacuees, evacuation center staff, and the city's CDRRMO by providing secure authentication, center recommendations, donation/payment tracking, and staff/admin workflows. The backend uses MongoDB (Mongoose) for data modeling and includes utilities for email/OTP flows, token management, and intrusion detection.

Backend Architecture: Layered (Model-View-Controller)

Backend Technology: JavaScript, PHP, MySQL

Security Features:

- Admin authentication flows (JWT). Implemented room CRUD, room requests, role-based authorization hooks, and frontend token handling; designed middleware and token-table architecture to secure mobile/web routes.

EvacuDesk

Role: Backend Dev

3RD YEAR COLLEGE PROJECT

EvacuDesk is built to improve evacuation center management in Dagupan City, Pangasinan. It supports evacuees, evacuation center staff, and the city's CDRRMO by providing secure authentication, center recommendations, donation/payment tracking, and staff/admin workflows. The backend uses MongoDB for data modeling and includes utilities for email/OTP flows, token management, and intrusion detection.

Backend Architecture: Layered (Model-View-Controller)

Backend Technology: Node.js, Express, MongoDB

Security Features:

- Implemented JWT authentication, bcrypt password hashing, OTP email flows, center-recommendation API, and robust models (Evacuee, EvacuationCenter, Admin). Added security detection via honeypot routes and canary token instrumentation to detect probing and abuse.
