

OLIVER ONDOY

Backend Developer | Cybersecurity

 Pangasinan, Philippines  oliverondoy@gmail.com  github.com/Sucrit

ABOUT ME

I am a 3rd-year Bachelor of Science in Information Technology (BSIT) student and backend developer at University of Pangasinan specializing in building secure, scalable systems and RESTful APIs. I have practical experience developing applications using the MERN stack, Laravel/PHP, and MySQL, with a strong focus on performance, reliability, and security best practices. In addition to backend development, I am an active cybersecurity practitioner conducting homelab-driven threat research to analyze real-world attack techniques and defensive strategies. This hands-on approach strengthens my ability to design resilient systems and identify vulnerabilities effectively.

I am continuously expanding my expertise by studying blockchain technologies and artificial intelligence/machine learning, with the goal of integrating modern, intelligent, and decentralized solutions into future projects. I am open to remote freelance opportunities where I can contribute to building secure, efficient, and scalable software systems while continuing to grow as a backend engineer and security professional.

EDUCATION

UNIVERSITY OF PANGASINAN Bachelor of Science in Information Technology	2024 - 2027
BUGALLON INTEGRATED SCHOOL Junior & Senior High School	2016 - 2022

SKILLS

- MongoDB
- Node.js
- Docker
- Github
- Python
- Express Framework
- MySQL
- Linux
- PHP (Laravel)
- TypeScript

PROJECTS

Roomfinder

Role: Backend Developer

2ND YEAR COLLEGE PROJECT

RoomFinder is a room management web and mobile platform for both students and officials of University of Pangasinan. that communicates with a PHP REST API protected by token-based authentication to provide room CRUD, schedule management, request/approval workflows, user/admin management, and dashboard analytics.

Backend Architecture: Layered (Model-View-Controller)

Backend Technology: JavaScript, PHP, MySQL

Security Features:

- Admin authentication flow. Implemented room CRUD, room requests, role-based authorization hooks, and token management; designed middleware and token-table architecture to secure mobile/web routes.

EvacuDesk

Role: Backend Developer

3RD YEAR COLLEGE PROJECT

EvacuDesk is built to improve evacuation center management in Dagupan City, Pangasinan. It supports evacuees, evacuation center staff, and the Dagupan City CDRMO by providing secure authentication, evacuation center management and recommendation features, and staff/admin workflows. The backend uses MongoDB for data modeling and includes utilities for email/OTP flows, token management, and intrusion detection.

Backend Architecture: Layered (Model-View-Controller)

Backend Technology: Node.js, Express, MongoDB

Security Features:

- Implemented JWT authentication, bcrypt password hashing, OTP email flows. Added security detection via honeypot routes and canary token to detect probing and abuse.
